Frameless coil (amorphous), fitted inside a foam mould that simulates a uterus. The especially well tolerated frameless coil was developed in 1984 by Dutch Dirk Wildemeersch: A nylon filament containing copper beads is anchored into the wall of the uterus. Due to the flexible form of the filament side effects are very rare.

Inventory number: 1636

Material: plastic, copper

Dimensions, in cm: 8,7 x 6,8 x 1,4

Date: before 2004
