

Gynaecological examination chair

www.muvs.org ©2013 Vienna

Around sixty years old and already a 'classic' in professional circles on account of its functionality and stability is the 70kg Sims-style gynaecological examination chair. The model was developed by the 'father of American gynaecology' James Marian Sims (1813-1883) in order to enable examination of women's genitalia. Until the mid 19th century, women were examined fully clothed: the woman would stand while the gynaecologist kneeled in front of her. At that time, 99.8% of gynaecologists were men. Our exhibit is an early post-war model constructed of half-inch water pipes, bicycle tubing and German army wooden feet for bed screens. It was sold by the Hamburg-based company Krauth. The rationale for its inclusion in our collection is that after the Second World War, Lübeck was one of the first cities to receive refugees from the former German areas in the East. Many of the women had been raped or for other reasons were not able to continue with their pregnancy. Consequently, a great

many abortions were carried out, including on this chair.
